

TRANSFORM YOUR LED DISPLAY

Create a diffuse,
film-like appearance
while eliminating
moiré interference.

Diffuser screens allow
your audience to be
closer to the viewing
surface while reducing
the appearance of the
pixel structure for
a smooth, **superior**
image.

IDEAL FOR DIGITAL SIGNAGE, BROADCAST & STAGING APPLICATIONS

How it works?

The translucent surface is placed on a custom-fabricated frame directly in front of the LED Display. The bright light emitting from the panel is diffused across the screen surface, smoothing out the image, reducing glare and eliminating the infamous moiré pattern common in broadcast applications.

Benefits:

- ▶ Scalable up to any size
- ▶ Invisible seams
- ▶ Cost-efficient: allows larger pixel pitch options to be perceived like finer pitch options
- ▶ Custom & lightweight frames for easy installation and removal
- ▶ Maintains color accuracy
- ▶ Eliminates glare and moiré interference
